AN INAUGURAL DISSERTATION
ON
Transmission of Hereditary Disease

SUBMITTED TO THE
PRESIDENT, BOARD OF TRUSTEES AND MEDICAL FACULTY
OF THE
University of Nashville,
FOR THE DEGREE OF
DOCTOR OF MEDICINE.

BY
C. W. Hoosman

OF
Kentucky

1857

JOHN YORK & CO.,
BOOKSELLERS AND STATIONERS,
NASHVILLE, TENN.
This great and engrossing subject can, and one naturally presents itself for inspiring all thinking and sensible persons who may contemplate or be about embarking in what the world seems a serious speculation. 

Matrimony, namely, the probability of issue and how far the health of the progeny may be influenced by that of the parent.

What conception requires the necessary aptitudes in both—man and wife—which is most suitable of the greatest men of the age and that although men's capacities are rarely absent but still all men are not prolific; hence the inference is that some
Come exist to account for such infertility. It may be local or physical. The prevailing resemblance between parents and children in features, form, and voice and even constitutional peculiarities is sufficiently well known to satisfy among one of the similar possibility of the transmission of a disease or to grave a character which is plain to all persons.

It is of great consequence to be well born, educated, and perfectly pure and uncontaminated from diseases of de-malignant a character as we have to encounter with and it would be a happy thing for
Immune Rhee of only such persons as are some of body and mind should be allowed to marry which would curtail the future prevention of some diseases of such a formidable type that is so prevalent in this helpless County of ours.

Anciently in Scotland if any were visited with the falling sickness such as madness joint leprosy or any dangerous diseases which was likely to be propagated from the father to his offspring he was instantly cast out to curtail the imperfect development of their bane which at the present day would be considered as inhuman and unlawful and incompatible with god's will and the law of nature.
And there former affected in like manner. They were kept from the Company of Men and of the Cherokees having some such dangerous diseases and with Child the with her offspring now t'wixt alive.

The Spottans also destroyed all weakly and deformed children. Why did the do so? They were great aspirants to strength. Thus was their theme. They would soon there thrive in of great strength for Thence to become pregnant and have children which would perpetuate the fame of such Character, and there mothers, which is looked upon with contempt and
Abhorrence and disgust in the present enlightened age of civilization.

I don’t see the anxiety to perpetuate our identities and to create new objects on whom we may concentrate all of our affections and love and who when born to us so instinctively bind us to their allure. This abiding attractive world, where is the one who does not feel humble and mortified at beholding in his own vanity looked for upspringing the unfolding of infirmity and disease. We are content to encounter the ordinary chance of mortality, but let our children bear the impress of health and prowess the
Shape of perfect man which is the decree of God's Best Law and Resoluting are the reflections that spring from observing in our souls the development of the viles that we have nurtured in ourselves, how many existing beings are there inhaling the breath of life in whom every respiration feeds the flame of desire ignited by those from whose lines they spring and is heating them to a premature time? How many are there secluded from the enjoyments of this which being deprived of by some deterrent sheathes or some other hideous deformity?
Which renders them like isolated wanderers on the earth and forever forbids their participation in the main charm of existence, the living specimens of human prototypes in whom reason is obliterated or never dawned.

Over such as the above mentioned generally recognized and acted upon a new impulse would be given to human activity and a new aspect would begin to appear throughout the scene of nature and general society.

But on the other hand, we have numerous specimens who drag on an existence inferior in enjoyment to the forest.
Hunter beast or The or The animal whose life is resembled for the detriment of Man. And or But the diseases that involve so calamitous a result as a despicable sin against which are traceable in particular families to the remotest periods of their ancestral records but while we remain in our sublunar existence our investigations into those hideous diseases that cause so many souls to take their flight from these tabernacles of clay to join those kindred spirits in the invisible world, I shoul not a knowledge of cause and effect be perfectly plain.
To all rational beings the symptoms are generally easily recognized when these diseases are developed. Like that just detailed it should induce individuals about to fulfill one of the purposes to which they were certainly destined for the perpetuation of their own race if only from the pride of human nature it is well to consider the result of such a consummation.

The diseases that have been mentioned is generally intuited among the categories of these children where there is a hereditary and these existing in parents
Which are candid about preliminary to the completion of the other. Though decidedly not more important arrangements of the spiritual contract if these should not be many
infirmities that are well known to have descended here-
turly. The contract is confirmed and counted in some cases but prematurely but from ignorance of such a result yet carefully concealed - cutaneous hemispheres incipient tuberculosis or some other disease which matrimony of the analogous changes which it effects in different constitutions which is hereby encouraged.
in this manner and other pellagra phenomena are aroused from their lurking places whether brain in the brain, the lungs, or the blood, which is transferred to those who succeed us. I need not therefore point to a line prefatory of the following illustrative definition of health by which any one with tolerable acumen may estimate the probable worth of a life which is to dwell for us or at all events for me be spared the fear of ignorance or misplaced confidence as when taking a step of such importance as rock the
There are numerous means of calculating upon the durability of human resistance by an examination of the countenance, the gait, the attitude, the form, the skin, the temperament, the breathing, the speech, the sleep, and in fact to a practical, professional eye, there is not much difficulty in observing some diagnostic marks of a hereditary diathesis which is secreted in the system and which is slowly and treacherously consuming the vitality of from.

The Constitution varies in appearance according to age. The health is
indented by a slump not
suffry or fenturer state of
the fuel but a fresh, Complexion
and also an absence of that
defesion around and
particularly below. The eye
so observable in persons of
hereditary aorthiss

The Comtenance assume

union takes less time to alter the fabric of the breast and shoulders than the drops of pieces. Also the decayed health and spirits which attend these infirmities and are never manifested in healthy, vigorous individuals. The same that attends extreme old age is somewhat analogous to the diseases which have been mentioned.

The temperament modifies the complexion in the sanguine, it is florid and soft; in the bilious, it is dark and rigid. In the phlegmatic, the lip and eyelids and the herringbone is modified by its general union with the two former.
in health and The Contumacy is expressive of Contentment and 
gazey which indicates a 
happy state of Mind and 
healthy Condition of body.

Vice Versa. Let your eye 
Rest for one moment on 
a Multiform Subject of Their 
Hereditary Development 
which is displaying Its

of Tubercles and when found elsewhere in the system. They are more advanced in these spots, and the situation of prevalence of Tuberculous Diseases varies also with the age of the subject and constitution of the blood of Tuberculous or Aerobacillus subjects, which comprises a diminution of the red particles and a preponderance of fibrin. So we can state that the causes which develop this condition and therefore induce Tuberculous Diseases, insufficient food, want of pure dry air, warmth and light, long continued mental depression, aggravated...
and prolonged diseases of the digestive organs insufficient secretion. And the injurious influence of fevers and other serious diseases are acknowledged causes of the development of tuberculous diseases excessive evacuation of blood or of the bowels, anaemia, secretion and severe cases of Mercury also predispose to phthisis and perhaps act chiefly by reducing the red particles of the blood and the quality of the plasma.

Yet this disease is closely allied to acute rhumatism and yet distinct from it.
The attack begins most commonly an hour or two after midnight. The disease generally makes its appearance in the joint or ball of the great toe. But sometimes in other parts of the foot the heel, the instep, the ankle, it is a problem of those who suffer it as amounting to torture. It is a grinding, crushing, wrenching pain. It is described by a Frenchman in this way: place your joint in a vice and screw the vice up until you can endure it no longer, that may represent chronicism. Then give the instrument another twist and you will obtain a notion of your own.
This is undoubtedly a hereditary disease. Although it is believed by some that it can be generated by certain habits of life. This disease is characterized by a excess of uric acid in the system, which is separated from the urine and is deposited in the joints in the form of chalky stones.
